

Testing, Evaluation and Troubleshooting Tools for Life-cycle Management of Synchrophasor Systems

International Synchrophasor Symposium
March 22-24, 2016

Prof. Mladen Kezunovic

Ahad Esmaeilian, Tamara Becejac,
Payman Dehghanian, Cheng Qian, Meng Wu

SMART GRID CENTER
TEXAS A&M ENGINEERING EXPERIMENT STATION

Agenda

SMART GRID CENTER
TEXAS A&M ENGINEERING EXPERIMENT STATION

1 Introduction to Life-cycle Management

2 PMU Calibration Lab

3 Gold PMU

4 Field End-to-end Calibrator

5 Application Testing

6 PMU-Based Bad Data Detection

Life-Cycle Management Spiral Model

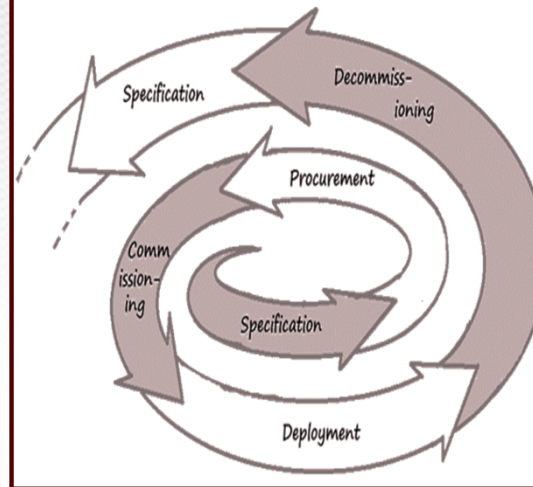

SMART GRID CENTER
TEXAS A&M ENGINEERING EXPERIMENT STATION

Why is needed?

- Laboratory tests are not enough
- Inappropriate installation
- Insufficient maintenance
- Improving monitoring, control and protection performance

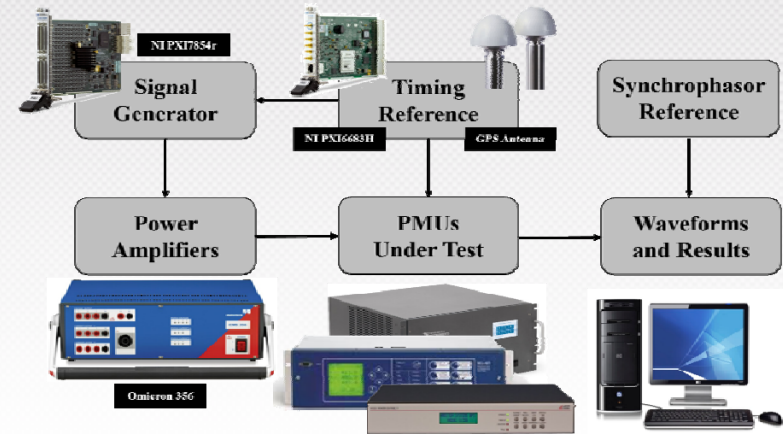

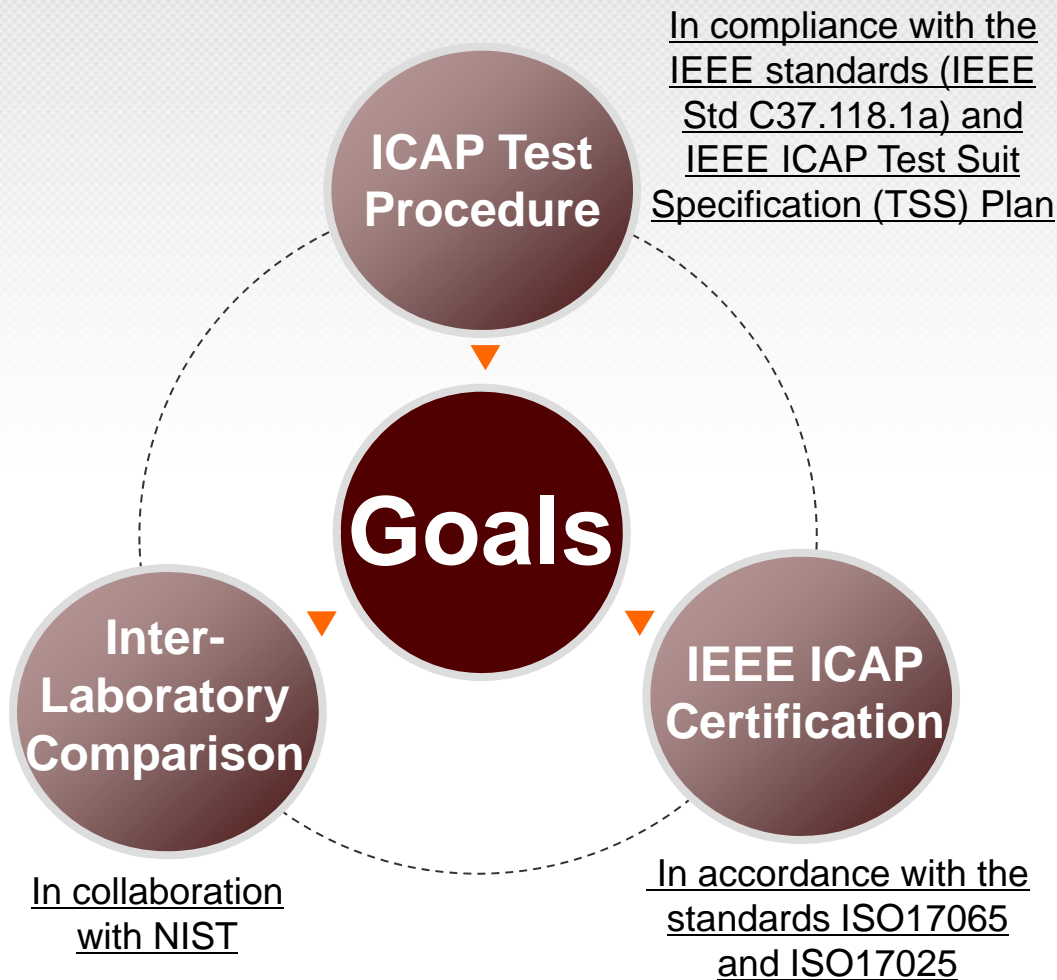

How it looks?

What it covers?

- Equipment certification before purchase
- System commissioning
- Periodic field testing
- Continuous hidden failure checking
- Operator awareness of system QoS deterioration

**Spiral Life-Cycle
Management**

Progress

- PMUs (or devices with PMU capabilities) from 3 different vendors are tested:
 - **National Instrument GAS**
 - **Arbiter**
 - **SEL**
- The developed test plan contains both static and dynamic tests:

Steady State Tests	Voltage/Current magnitude sweeping test
	Voltage/Current angle sweeping test
	Frequency sweeping test
	Harmonic distortion test
	Out-of-band interference test
Dynamic State Tests	Measurement bandwidth test
	Frequency ramp test
	Magnitude/Angle step test

PMU Calibration Lab Performance Evaluation

Frequency Error

Amplifiers in the PMU Testing Procedure Loop

Why Amplifiers Matter for PMU Testing?

- Amplifiers could change conditions under which PMUs should be tested by introducing additional modulations, distortions, unwanted phase shifts, etc.
- Our test results proves the fact that selection of different amplifiers will affect the PMU test performance differently.
- Amplifier test plan has been developed in response to recognize the general amplifier performance for PMU testing.

Gold PMU characteristic

ROCOF Test Results

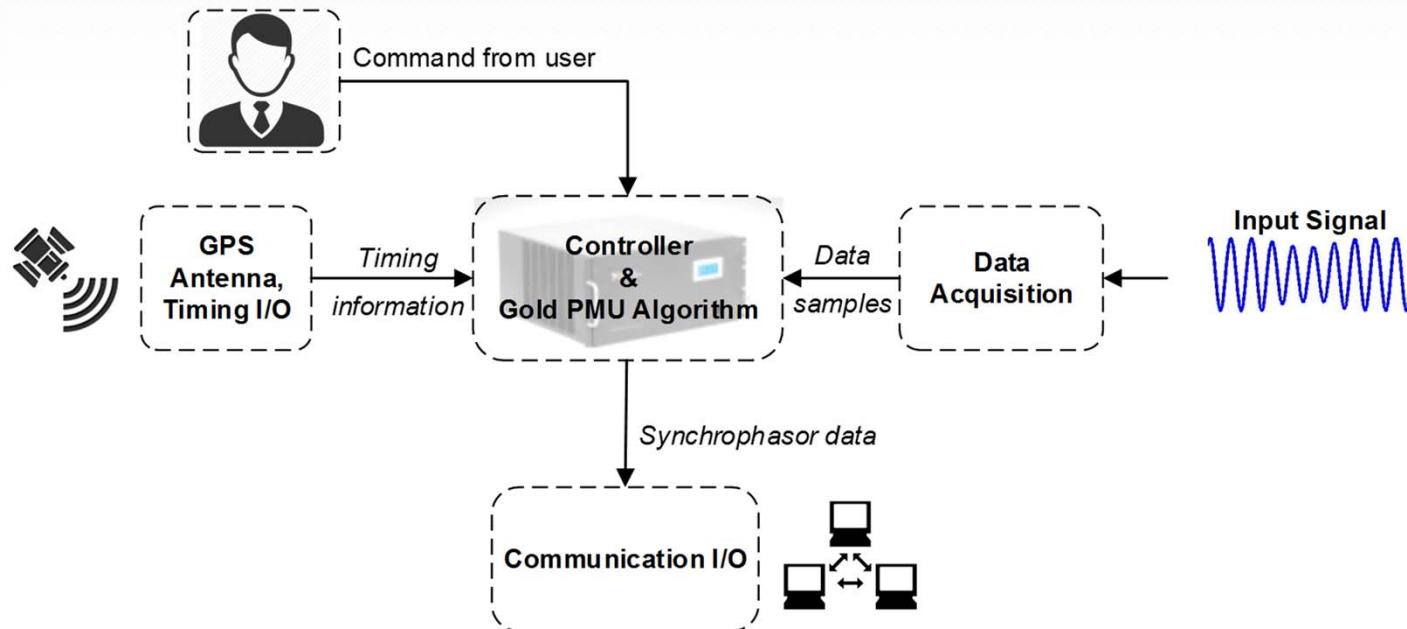

Test Type	IEEE Standard	2nd Order Polynomial Fitting	Proposed Method
Steady-State Test	0.4(P) 0.1(M)	44	5×10^{-4}
Harmonic Test	0.4(P)	60	10^{-3}
Frequency Ramp Test	0.4(P) 0.2(M)	60	0.04
Modulation Test	0.2(P) 2(M)	8	0.2

Gold PMU Implementation

Gold PMU Hardware Implementation

- Acts as a PMU reference, interfaced to the field end-to-end calibrator
- Composed of CPU, Data Acquisition, Timing, Communication Modules...

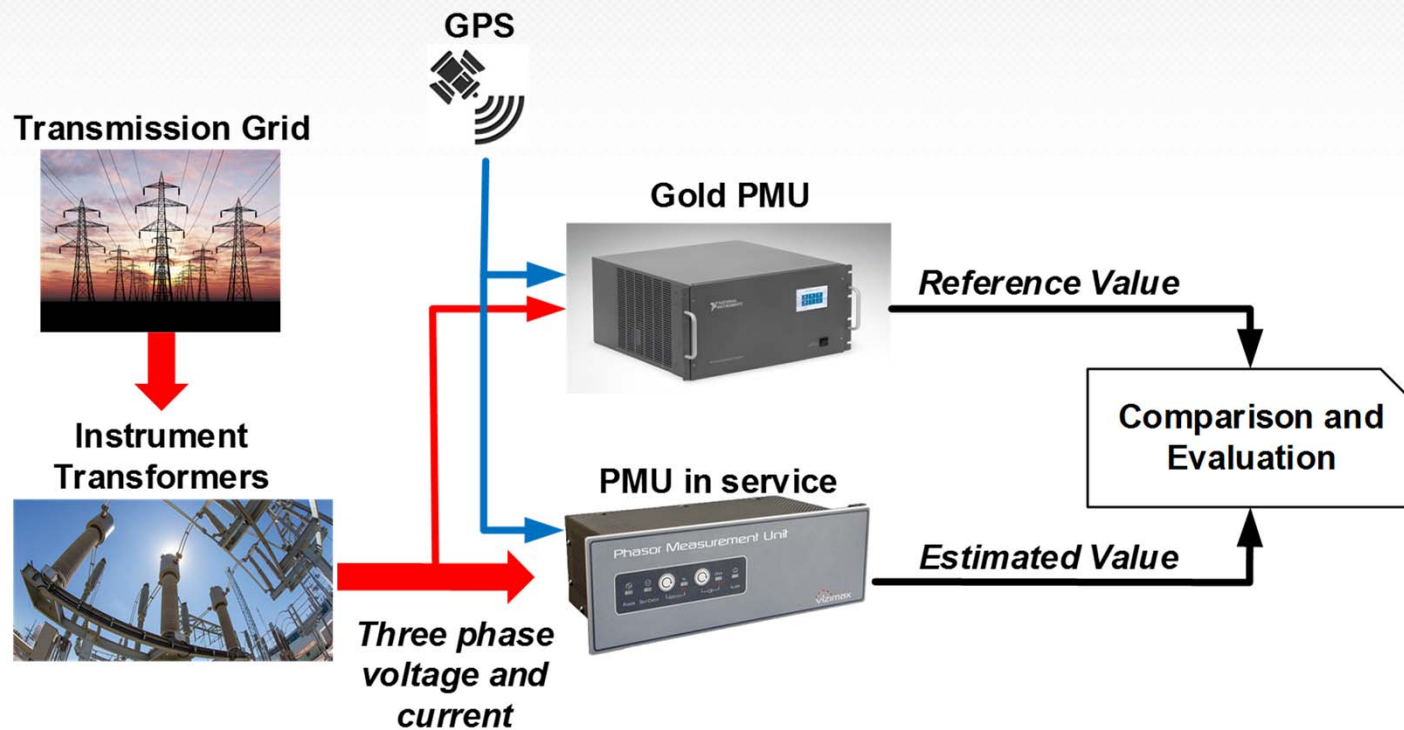

Gold PMU Use Case

Use Cases – Installed in Substations

- Perform testing and calibration for in-service PMU.
- Portable so that it can be used for PMU testing and calibration.

Testing in the field environment

Periodic maintenance testing of the PMUs

- Periodic testing is desirable due to possible degradation of the equipment over time
- Testing is conducted according to IEEE standards
- PMUs are tested in substation

Nested testing of the Synchrophasor system

- In case when bad data is detected
- Testing layer by layer of the system

Timing reference

PMU device

Communication link and PDC

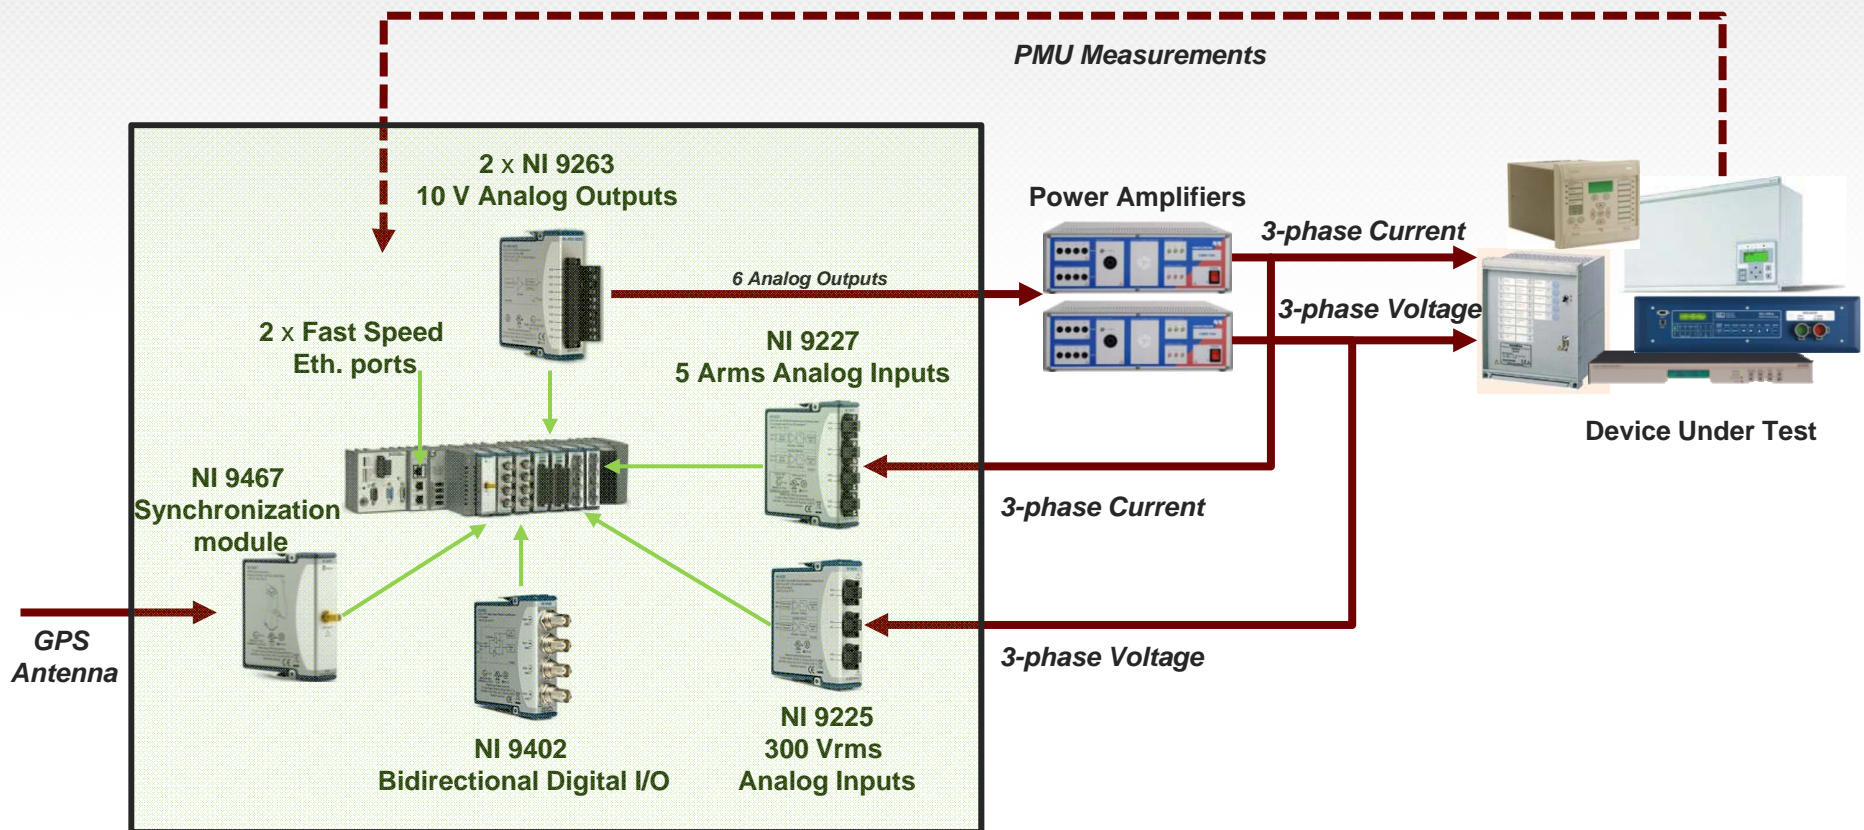

Application layer and Visualization

Portable Field End-to-End Calibrator – Use Case 1

PMU-Based Bad Data Detection Evaluation Method

PMU-Based Bad Data Detection in Enhanced State Estimation

- Testing and Certification Equipment and Protocols**
- Certification Lab for Device and End-to-end Testing**
- Initial Gold PMU Algorithm to Be Used as Synchronphasor Reference.**
- Field Calibrator using Gold PMU Algorithm**
- Application End-to-end Nested Testing & Bad Data Detection**

Thanks

Any Question?
